PRACTICAL 2

AIM :

Using Packet Tracer, create a basic network of two computers using appropriate network wire. Use Static IP address allocation and show connectivity.

1. Static routing method is most trusted by a router.
2. Static routing is not really a routing protocol.
3. Static routes do not dynamically adapt to network changes, are not particularly scalable, and require manual updating to reflect changes.

Static routing has the following advantages

1. There is no bandwidth usage between routers, which means you could possibly save money on WAN links.
2. There is no overhead on the router CPU, which means you could possibly buy a cheaper router than you would use if you were using dynamic routing.
3. It adds security because the administrator can choose to allow routing access to certain networks only.

Static routing has the following disadvantages

1. Static routes don't dynamically adapt to network change.
2. If a network is added to the internetwork, the administrator has to add a route to it on all routers—by hand.
3. It's not feasible in large networks because maintaining it would be a full time job in itself.
4. With static routing, as your network grows, it can be difficult just to keep adding static routes to make sure everybody can still get everything.
5. The administrator must really understand the internetwork and how each router is connected in order to configure routes correctly.

There are two different styles to configure an “ip route” command:

1. Using a next hop IP address
2. Using an outgoing interface

Consider the following network

We configure it as follows

Step 1: (configure PC 0)

PC0

IP Configuration

IP Configuration

☐ DHCP ☒ Static

IP Address: 10.0.0.2

Subnet Mask: 255.0.0.0

Default Gateway: 10.0.0.1

DNS Server:

IPv6 Configuration

☐ DHCP ☐ Auto Config ☒ Static

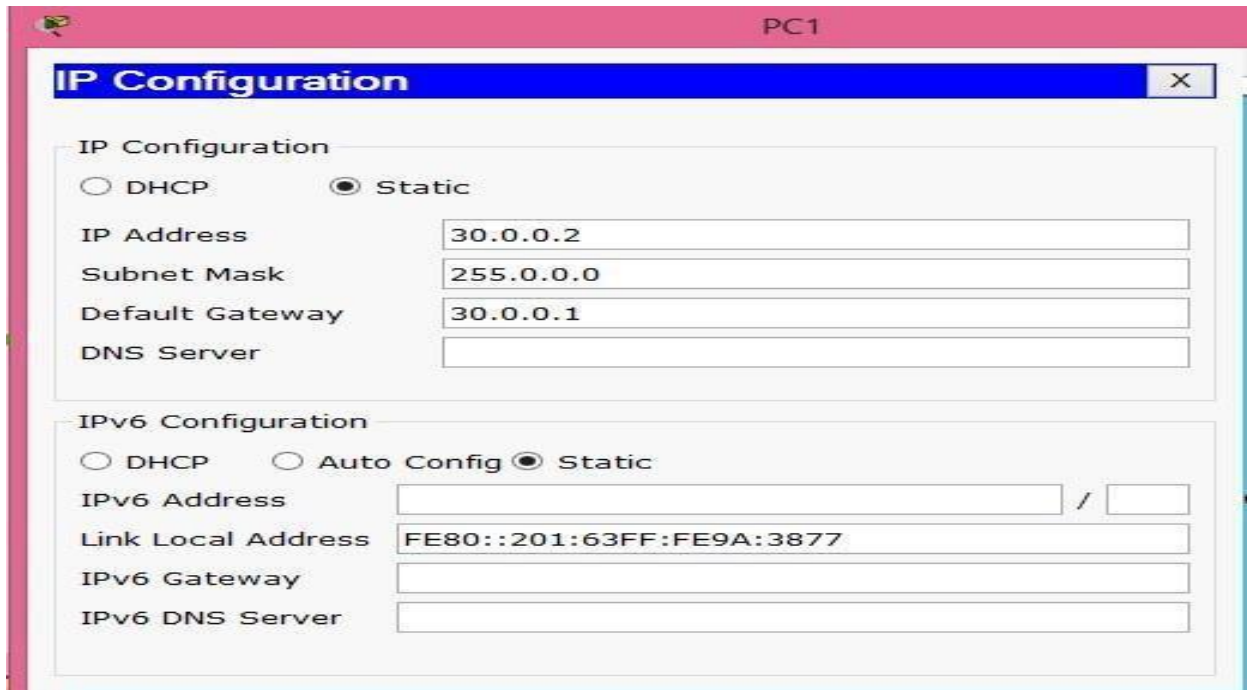

IPv6 Address: /

Link Local Address: FE80::201:C9FF:FE5B:90A4

IPv6 Gateway:

IPv6 DNS Server:

Step 2: (configure PC 1)

The image shows a window titled "PC1" with a sub-header "IP Configuration". It contains two sections: "IP Configuration" and "IPv6 Configuration".

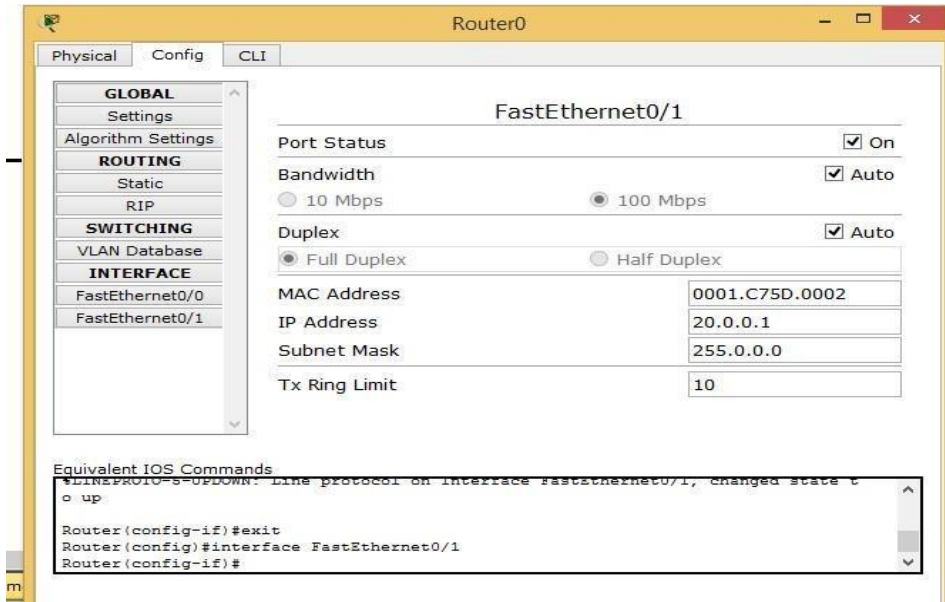

IP Configuration

- ☐ DHCP
- ☒ Static
- IP Address: 30.0.0.2
- Subnet Mask: 255.0.0.0
- Default Gateway: 30.0.0.1
- DNS Server: (empty)

IPv6 Configuration

- ☐ DHCP
- ☐ Auto Config
- ☒ Static
- IPv6 Address: (empty) / (empty)
- Link Local Address: FE80::201:63FF:FE9A:3877
- IPv6 Gateway: (empty)
- IPv6 DNS Server: (empty)

Step 3: (configure Router 0)

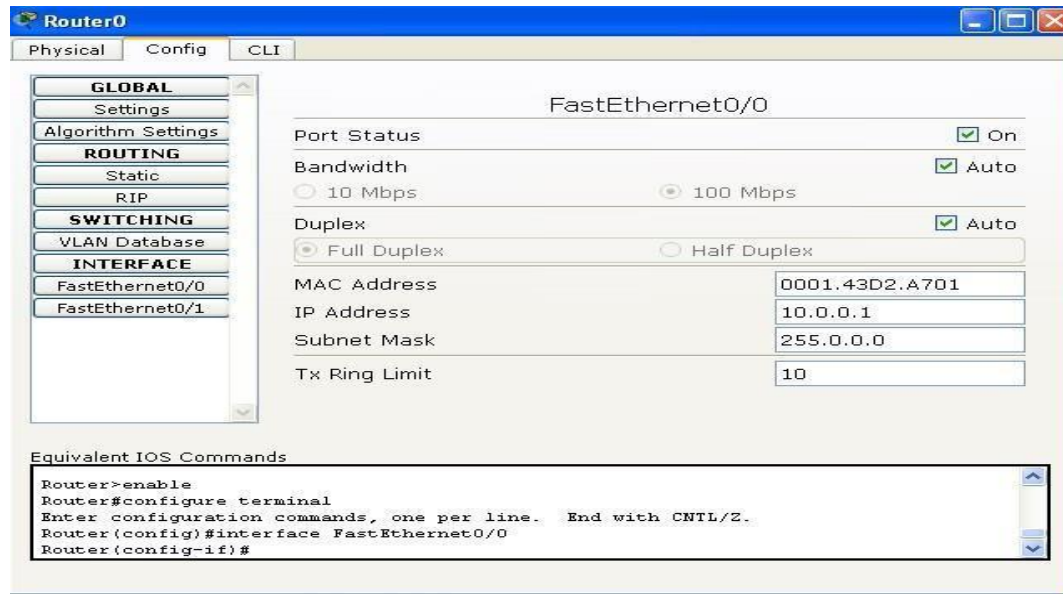

The image shows a window titled "Router0" with tabs for "Physical", "Config", and "CLI". The "Config" tab is active, showing the configuration for "FastEthernet0/1".

FastEthernet0/1

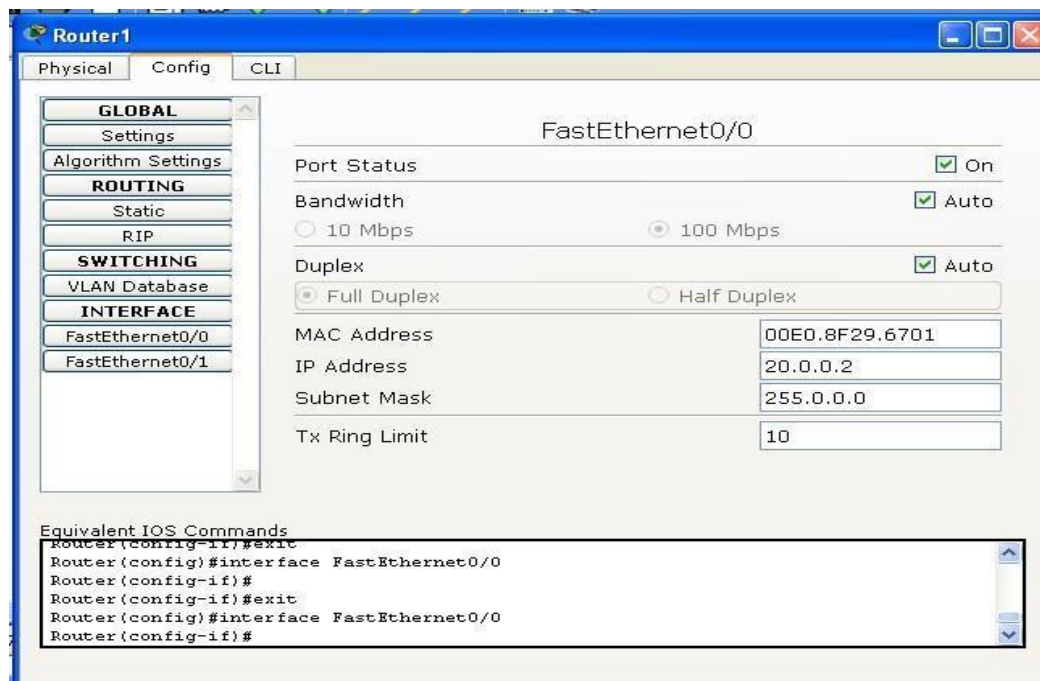

- Port Status: ☒ On
- Bandwidth: ☒ Auto
- Duplex: ☒ Auto
- MAC Address: 0001.C75D.0002
- IP Address: 20.0.0.1
- Subnet Mask: 255.0.0.0
- Tx Ring Limit: 10

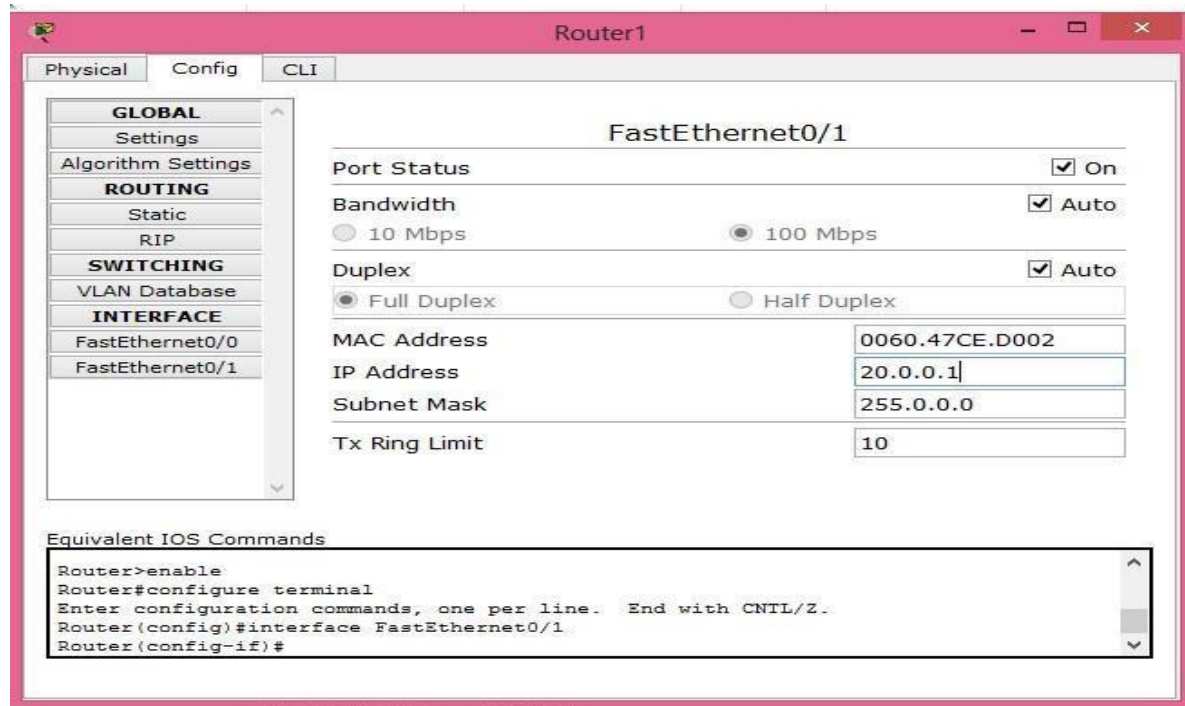

Equivalent IOS Commands

```
Router0>enable
Router0>configure terminal
Router0(config)#interface FastEthernet0/1
Router0(config-if)#ip address 20.0.0.1 255.0.0.0
Router0(config-if)#no shutdown
Router0(config-if)#exit
```

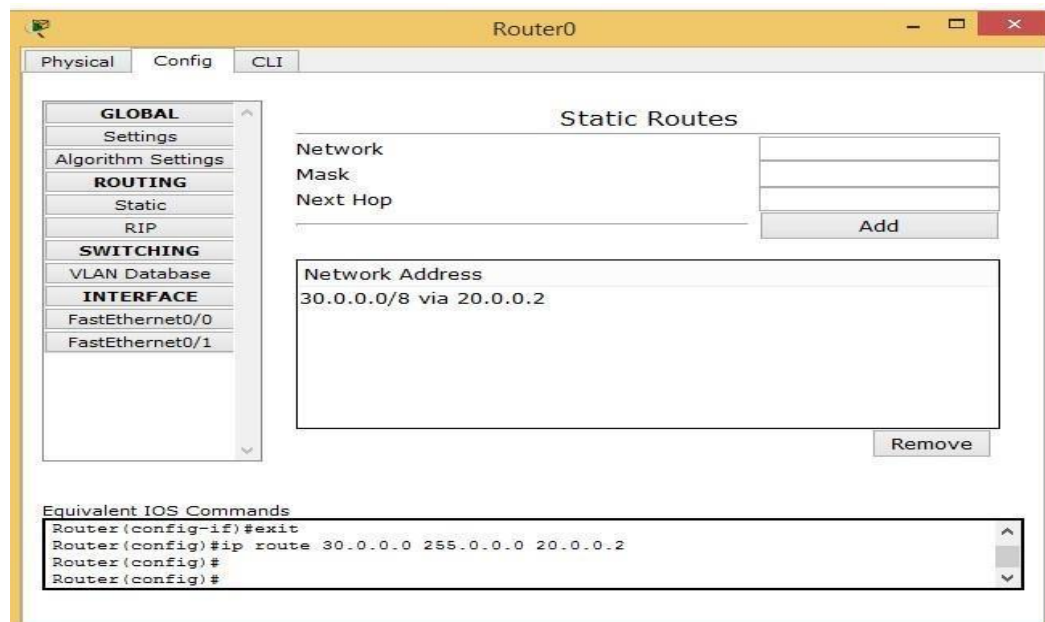

Step 4: (configure Router 1)

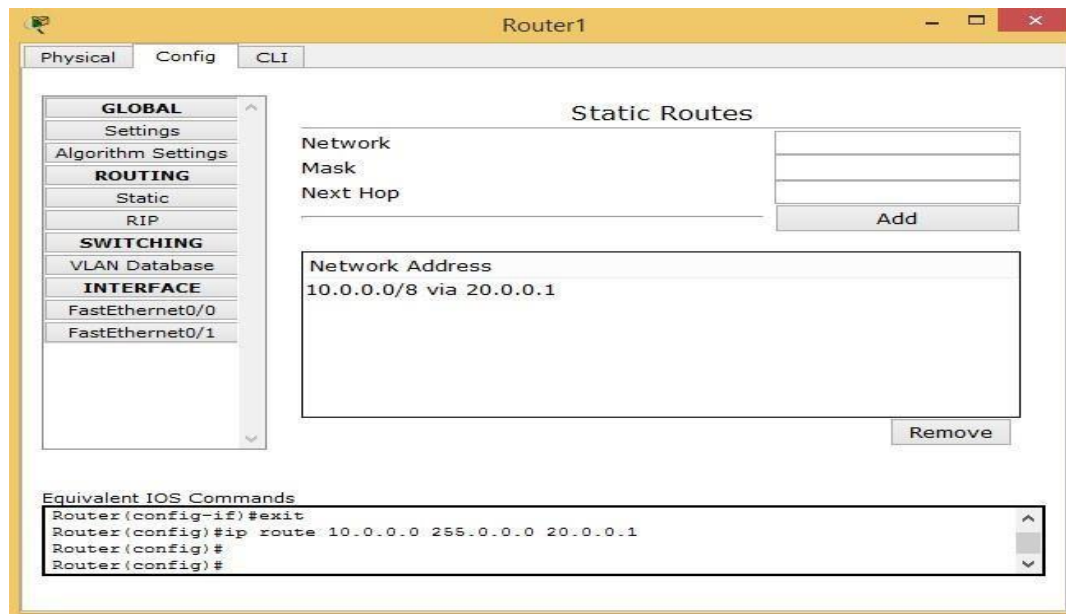

The routing table is configured in the following way For router 0

For router 1

Now we can give the ping command as shown to check the connectivity
